(Summer Outlook Issue)

Summary

Farmers are now making plans for the seeding of winter wheat ~~and rye~~ to be harvested in 1939. This issue of The Wheat Situation, therefore, has been prepared with particular reference to the outlook for wheat ~~and rye~~ <sup>crop</sup> to be seeded this fall. Attention is also given, however, to the current domestic and world wheat situation.

Summary of wheat and rye outlook for 1939

World wheat prices for the 1939-40 marketing year will remain low relative to recent years, says the Bureau of Agricultural Economics, unless there is a material reduction in acreage or a considerable improvement in world economic conditions and in the world price level. United States wheat prices probably will average somewhat above world levels if domestic production is reduced more nearly in line with domestic disappearance or if a loan is in effect covering the 1939-40 marketing season.

The acreage allotted for seeding the 1939 wheat crop under the Agricultural Adjustment Act of 1938 is 55 million acres. This compares with the 1928-32 average seedings of 67 million acres, and 81 million acres seeded for the 1938 crop. The extent of the participation by farmers in the acreage adjustment program is uncertain. If total wheat seedings are reduced to 55 million acres, and average yields per seeded acre are obtained, production would amount to about 660 million bushels. This would be less than the average domestic disappearance of about 680 million bushels, and would provide an opportunity to bring about a reduction in

carry-over during the next marketing year. If two-thirds to one-half of the 1939 acreage is seeded by growers who keep within their acreage allotment, seeded acreage would be expected to be 60 to 65 million acres. Average yields on such acreages would result in a production 40 to 100 million bushels more than average domestic disappearance.

If the wheat growers in the United States should reduce their acreage to about the 60-million acre level, and this reduction was not offset by increases in other countries, such a reduction would reduce world acreage\* so that production,\* on the average, would about equal the world's annual wheat disappearance\*.

With rye prices only little more than half of what they were in 1937 and feed supplies ample, growers will probably reduce their rye acreage from that of this year, when it is estimated that 3,914,000 acres were harvested. For the 5 years, 1928-32, the harvested acreage averaged 3,315,000 acres. It is not probable, however, that the acreage next year will decline to this average. An average acreage with average yields would produce a crop of about 40 million bushels which would take care of domestic disappearance. If the acreage is larger than average and yields per acre are average, the excess of supply over disappearance would be expected to be increased, unless price and supplies of rye relative to other feed grains induced increased feeding.

#### Summary of outlook for wheat harvested in 1938

Prospective world wheat supplies\* for the year beginning July 1, 1938, are now indicated to be about 495 million bushels more than a year ago. World stocks of old wheat\* on about July 1 have been estimated at about 620 million bushels, or about 75 million bushels more than a year earlier. Estimated world wheat production\* is now estimated at around 4,255 million bushels, which is 420 million bushels more than the crop of last year. The crop in the Northern Hemisphere\* is

\* All references to world and Northern Hemisphere supplies, production and disappearance exclude Soviet Russia and China unless otherwise stated.

indicated to be about 3,786 million bushels, or 395 million bushels more than last year. On the basis of weather conditions to date, a production of 250 million bushels is indicated for Argentina and 150 million bushels for Australia, which together represent an increase of about 25 million bushels compared with last year.

World trade in wheat and flour in 1938-39 is now expected to be 25 to 50 million bushels larger than last year. However, with larger crops in prospect this year in European exporting countries, Canada and Argentina, wheat from the United States will meet greater competition in foreign markets and exports will be less than in 1937-38 unless the Federal Government takes steps to stimulate exports.

If there is not much change in demand, the large wheat supply in prospect this year will result in lower world prices than were received in 1937-38. With supplies in the United States large, domestic prices are expected to continue below prices at Liverpool. Domestic prices are now materially below the loan level and there will be a strong tendency for farmers to take advantage of the loan, which would continue to restrict market receipts and give support to prices. On the other hand, with large supplies and a not very favorable export situation, any price advances which might occur probably will be limited.

#### Summary of the rye and flaxseed situations

Rye supplies in 1938-39, estimated at 62 million bushels, are 10 million bushels or more in excess of usual domestic disappearance. These supplies may result in a large carry-over at the beginning of the 1939 crop year because export prospects are less favorable than last year and there are ample supplies of feed grains on hand.

The total domestic utilization of flaxseed in 1938-39 may again be made up of more than one-half foreign flaxseed. On the basis of present yield figures and prices of flaxseed and wheat, it appears that farmers will receive considerably larger returns this year per acre of flaxseed than per acre of wheat. While flaxseed prices during the next few months will probably be slightly below the general level of prices a year ago, they are expected to continue well above prices during the years 1930-35.

## WHEAT: SOURCES OF U. S. SUPPLY, 1923-38

Figure 1

United States wheat production in 1937 and 1938 was again large following 4 years of small production, which reduced the record carry-over stocks accumulated from 1929 to 1933. Imports, representing an average of  $\frac{3}{2}$  percent of total supplies, were necessary in 3 of these 4 years to make up shortages in hard red spring and durum supplies.

<sup>1/</sup> 1923 to 1926 Bradstreets, excluding country elevator stocks.

<sup>2/</sup> Stocks in merchant mills and elevators - 1923 and 1924 estimated in absence of actual figures; 1925 to 1938, Bureau of Census figures raised to represent all merchant mills. Stored for others - 1923 to 1929 estimated in absence of actual figures; 1930 to 1938, Bureau of Census figures raised to represent all merchant mills.

<sup>3/</sup> From reports of Foreign and Domestic Commerce of the United States. Imports include full-duty wheat, wheat paying a duty of 10 percent ad valorem, and flour in terms of wheat; and exclude flour free for export as follows: 42,742 bushels in 1935-36; 14,363 bushels in 1936-37; and 93,737 bushels in 1937-38.

<sup>4/</sup> Includes durum wheat returned from Montreal estimated at 1,500,000 bushels.

<sup>5/</sup> Indicated August 1, 1938.

<sup>6/</sup> For 1937 excludes new wheat estimated at 12,500,000 bushels; for 1938 excludes 13,423,000 bushels reported as new wheat by Bureau of Census.

WHEAT: DISTRIBUTION OF U. S. SUPPLY, 1923-37

4 INCLUDES FLOUR MILLED FROM DOMESTIC WHEAT ONLY

U. S. DEPARTMENT OF AGRICULTURE

Figure 2

NEG. 31821

BUREAU OF AGRICULTURAL ECONOMICS

The large production in 1937 again increased carry-over stocks on July 1, 1938 to above average for the years before record stocks accumulated from 1929-33. Exports of about 100 million bushels were possible in 1937-38 because of small crops in Canada and Argentina. The quantity of wheat fed largely accounts for the variations in total annual domestic disappearance.

1/ From reports of Foreign and Domestic Commerce of the United States. Exports include only flour made from domestic wheat; 1923-35 estimated on basis of total exports less wheat imported for milling in bond and export adjusted for changes in carry-over; beginning 1935 figures for exports of flour wholly from United States wheat.

2/ Shipments are to Alaska, Hawaii, Puerto Rico, and Virgin Islands (Virgin Islands prior to December 31, 1934 included with domestic exports).

3/ Balancing item.

4/ For individual items see supply section.

ALL WHEAT: ACREAGE SEEDED, YIELD PER ACRE,  
AND PRODUCTION, UNITED STATES, 1919-38

U. S. DEPARTMENT OF AGRICULTURE

Figure 3

NEG. 29391 BUREAU OF AGRICULTURAL ECONOMICS

The wheat acreages seeded for harvest in 1937 and 1938 were the largest on record. Production in 1933-36 was greatly reduced as the result of small yields per acre caused by drought and rust. Yields per seeded acre have been below average since 1931.

All Wheat: Acreage seeded, yield per acre, and  
production, United States, 1919-38

Year	Seeded acreage	Yield per seeded acre	Production

## WHEAT: STOCKS IN MAJOR EXPORTING COUNTRIES AND AFLOAT, AS OF JULY 1, 1922-38

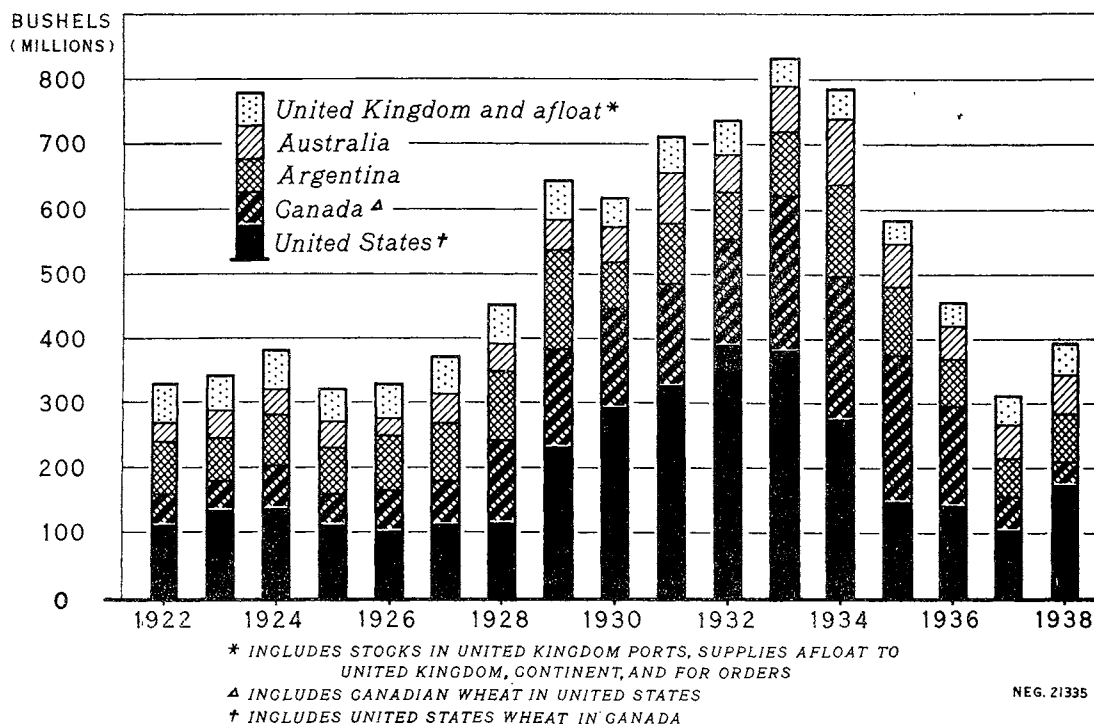

Figure 5

After reaching record size in 1933, stocks of wheat in major exporting countries and afloat by 1937 had been reduced to about the level which existed from 1922 to 1927. This reduction was largely the result of small world crops. The large stocks which accumulated from 1929 to 1933 were partly the result of increased production, but they also resulted from measures which importing countries took to reduce their wheat imports, and the effect on demand of the world-wide depression. Stocks were again increased in 1938. With world production in 1938 greatly in excess of usual world disappearance, stocks in 1939 are expected to be substantially larger than in 1938.

Wheat: Stocks in major exporting countries and afloat, as of about July 1, 1922-38

WHEAT: ESTIMATED ACREAGE, YIELD, AND PRODUCTION, WORLD  
( EXCLUDING SOVIET RUSSIA AND CHINA ), 1923-37

U. S. DEPARTMENT OF AGRICULTURE

Figure 6

BUREAU OF AGRICULTURAL ECONOMICS

World wheat acreage has been steadily increasing over a period of years while yields per acre have been declining. Average yields on the present level of acreage would result in production in excess of average annual world disappearance. Yields per acre in 1938 are above average and the carry-over will accordingly be increased.

NEG. 20691

BUREAU OF AGRICULTURAL ECONOMICS

Large wheat supplies in 1938-39 will result in world prices lower than in 1937-38. Prices in Liverpool reflect changes in world supply and demand conditions for wheat. In other countries prices may be relatively higher or lower than those at Liverpool as a result of domestic conditions, including governmental control.

WHEAT: PRICES AT LIVERPOOL AND KANSAS CITY, AND NET EXPORTS FROM UNITED STATES, 1923-38

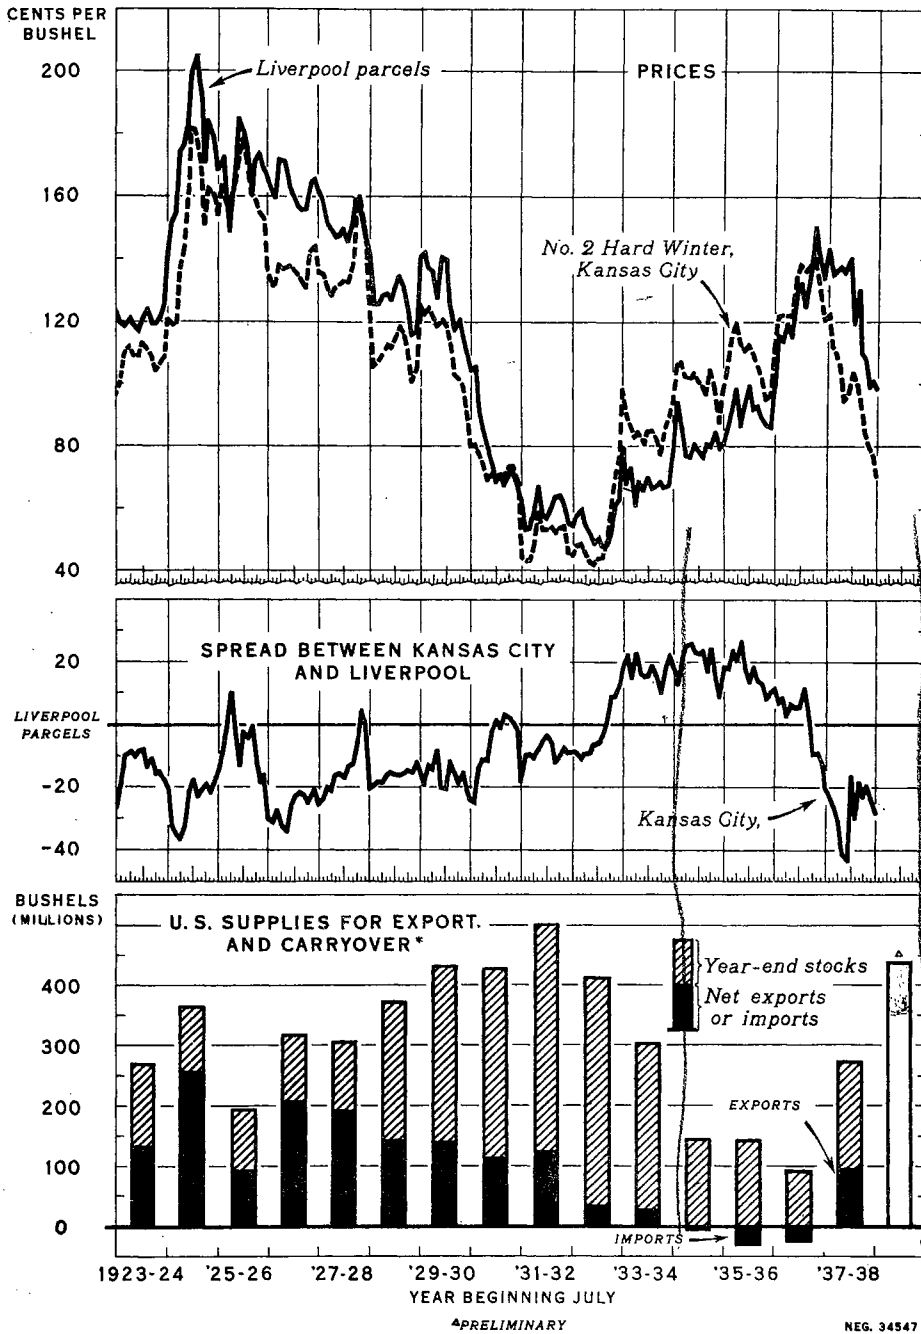

Figure 8

In 1937 wheat prices in the United States adjusted to an export basis, after having been materially above world prices since the beginning of 1933. High prices relative to Liverpool were largely the result of 4 successive years of very small production in the United States. The general trend in wheat exports during recent years has been downward, but small supplies in other surplus wheat producing countries resulted in exports of about 100 million bushels in 1937-38. Large supplies are available for export and carry-over in 1938-39.

OUTLOOK FOR 1939 WHEAT 1/ CROP

BACKGROUND 2/- The acreages seeded to wheat for harvest in 1937 and 1938, estimated at 81 million acres, were the largest in the history of the country. The acreage seeded for harvest in 1919 was the largest on record up to that time. For the 1919 to 1924 crops, seeded acreage declined from 77 million to 56 million acres. By 1928, however, it had risen again to 71 million acres and during the 1924-33 period averaged 65 million acres. For the 1934 crop, seeded acreage was reduced to 64 million acres, but the next year it was increased again to 69 million acres and for the 1936 crop was raised to 74 million acres. (Seeded acreage shown on fig. 3 and 4).

The present world acreage of approximately 288 million acres is about 17 million acres, or about 6 percent, above that necessary with average yields per acre, to produce a crop equal to the 10-year (1927-36) average annual disappearance of about 3,775 million bushels (fig.7). World yields per acre have fluctuated within a very narrow range, since wide variations in various regions of the world have been largely compensating. In most years the range is only about one-half bushel above or below the 14-bushel average. During the 15 years, 1923-37, yields were lowest in 1936 when they averaged 12.8 bushels and highest in 1928 when they were 15.1 bushels (fig.6).

Unless the world wheat acreage is adjusted downward, very large supplies will probably continue to be burdensome during the 1939-40 season and any improvement in world prices would depend upon improvement in demand. Wheat prices in the United States are expected to average above world levels (fig.8) if domestic production is about equal to or less than domestic requirements or if a loan 3/ is in effect.

The acreage allotted for seeding the 1939 wheat crop under the Agricultural Adjustment Act of 1938 is 55 million acres. This compares with the 1928-32 average seedings of 67 million acres, and 81 million acres seeded for the 1938 crop (fig.3). The extent of the participation by farmers in the acreage adjustment program is uncertain. If total wheat seedings are reduced to 55 million acres, and average yields per seeded acre are obtained, production would amount to 660 million bushels. This would be less than the 10-year (1928-37) domestic disappearance of about 680 million bushels (fig.2), and would provide an opportunity to bring about

1/ Rye outlook statement on page 33 .

2/ See also background statements on pages 15 and 21 .

3/ Wheat loans are mandatory under the Agricultural Adjustment Act of 1938 when the farm price on June 15, or any time thereafter, is below 52 percent of parity, or when the July crop estimate is above normal year's domestic consumption and exports. Loans to cooperators are at the rate of 52 to 75 percent of parity; to non-cooperators at 60 percent of the rate applicable to cooperators. Loans are made to non-cooperators only in marketing quota years on as much of their wheat as would be penalized if marketed. Loans not available in years for which marketing quotas were rejected by referendum.

a reduction in stocks during the marketing year. With a production of around 660 million bushels, domestic prices might rise above world levels, although the large stocks would tend to offset the influence of the smaller crop. Large carry-overs of milling wheat in prospect for July 1, 1939 assure ample supplies by classes in 1939-40.

If two-thirds to one-half of the wheat growers kept within their acreage allotments in 1939 and other growers planted about their usual acreage, seeded acreage would be expected to be 60 to 65 million acres. Average yields on such acreages would result in production of 720 to 780 million bushels, or 40 to 100 million bushels more than average domestic disappearance. In most years the range in yields per seeded acre is between 10 and 14 bushels. Seedings of 60 million acres in 1939 on this basis would result in a probable production of 600 to 840 million bushels, or somewhere within the range of 80 million bushels less to 160 million bushels more than average domestic requirements.

If the wheat growers in this country should reduce their acreage to about the 60-million acre level, and this reduction was not offset by increases in other countries, such a reduction would reduce world acreage so that production, on the average, would about equal the world's annual wheat disappearance.

Production in excess of domestic disappearance, which includes wheat for feed (fig. 2), must either be exported or go to enlarge the domestic carry-over (fig. 8). World trade in wheat has declined sharply since the peak year of 1928-29, largely as the result of drastic restrictions on imports and increased production in major importing countries. In the early part of this period exports from the United States declined with those from other surplus producing countries. During the period 1934-36 small crops in the United States, the result of abnormally low yields per seeded acre, were followed by net imports. In 1937 production in the United States was again large (fig. 8) and about 100 million bushels were exported leaving about 70 million bushels to be added to the carry-over (fig. 2). Large-scale exports in 1937-38 resulted from the small world carry-over and small crops in Canada and Argentina. Exports during 1938-39 are unlikely to be as large as last year unless the Federal Government takes steps to stimulate exports. Unless production in other major exporting countries is unusually small or there is a considerable increase in export demand beyond present expectations, the export market for United States wheat in 1939-40 will be less favorable than in 1937-38 or 1938-39.

#### THE WORLD WHEAT SITUATION

BACKGROUND.- Total world supplies\* increased sharply from 1924 to 1933 (fig. 7), largely as the result of the increase in acreage. From 1933 to 1936 world supplies declined following successive years of small production and increased world demand. In 1937 world supplies were only moderately larger than in 1936. Apparent world disappearance has averaged about 3,775 million bushels during the past 10 years.

\* Stocks, production, and disappearance for Soviet Russia and China are excluded throughout this report.

During the 1924-33 period, when world supplies were increasing, world prices declined, reaching the low point as supplies reached the high point. From the spring of 1933 to the summer of 1937, world prices moved steadily upward, reflecting higher world commodity price levels, four successive below-average harvests in North America, and the 1935-36 short Southern Hemisphere crop. In 1936-37 wheat prices advanced sharply as a result of increased demand and the smallest supplies in recent years. Then, during the 1937-38 selling season, wheat prices declined generally, with somewhat larger supplies, uncertain prospects for world business activity, and weakness in the general price level.

Prospective world wheat crop largest on record

The estimated world wheat production\* in 1938 <sup>4/</sup> is now indicated at around 4,255 million bushels, which is 420 million bushels more than the 1937-38 crop. The Northern Hemisphere total now appears to be about 395 million bushels above that of last year. Of this amount North America accounts for 230 million bushels. On the basis of weather and yield studies the total crop in Canada <sup>5/</sup> is placed at 330 million bushels.

The first estimate of winter wheat production this year in Canada is placed at 20,037,000 bushels, harvested from 742,100 acres, a yield per acre of 27 bushels. The yield per acre in 1937 was 26 bushels. The acreage of spring wheat sown in the Prairie Provinces is estimated at 24,946,000 acres, which is an increase of 347,000 acres over the 1937 spring wheat acreage in these provinces. On the basis of weather and condition to date, the Canadian crop is now forecast at around 330 million bushels. The Dominion Bureau of Statistics reported that the condition of the spring crop had declined during July, and on July 31 was estimated to be 82 percent of the long-time average compared with the June 30 estimated condition of 91 percent. Conditions in the Prairie Provinces were variable. In Manitoba the condition on July 31 was the same as a month earlier but was slightly below that of July 1937. In Saskatchewan spring wheat deteriorated appreciably. High temperatures and lack of sufficient moisture caused considerable damage. Widespread rust and extensive grasshopper damage also were contributing factors to the decline from 95 percent of normal, at the beginning of the month to 75 percent at the end of July. This condition figure, however, compares very favorably with that of only 14 percent on July 31, 1937. In Alberta no change has been noted during the month.

During the first half of August good harvesting progress was made throughout Canada. The effects of stem rust in Manitoba and eastern Saskatchewan are becoming more apparent as harvesting takes place and yields of susceptible varieties will be reduced appreciably. Grasshoppers are active and doing considerable damage in parts of Manitoba and Saskatchewan. Severe hail storms took heavy toll in parts of Saskatchewan and Alberta. Some loss from the wheat stem sawfly was reported in Alberta, where warm bright weather is now needed to hasten ripening.

<sup>4/</sup> Includes the Southern Hemisphere where harvest extends into early 1939.

<sup>5/</sup> See page 22 for discussion of crop prospects in the United States.

A total production of around 1,670 million bushels is now indicated in Europe, excluding Soviet Russia (table 1). This would be the largest harvest reported since 1933. Uniformly favorable growing and harvesting conditions during July improved the crop outlook materially. The increased estimate is largely the result of better outturns than previously indicated for the Danube Basin and the Mediterranean area--especially for Italy and France. The harvest in the Danubian countries and in Greece and Turkey is now virtually finished and a record crop is forecast. The Danube Basin crop is estimated at 436 million bushels compared with the previous record of 384 million bushels reported in 1936.

Estimated production of durum wheat in the four principal producing countries of Italy, Algeria, Morocco and Tunisia is placed at 119,536,000 bushels compared with 120,500,000 last year and 107,680,000 bushels, the 5-year (1932-36) average (table 11).

In Soviet Russia unfavorable weather prevailed over a large part of the country during the past month, resulting in crop deterioration in a number of regions. The Berlin office of the Bureau of Agricultural Economics reports that prospects for winter crops are, on the whole, more favorable than for spring crops. In the important producing Volga region, prospects are reported to be definitely low, as hot dry weather has been unbroken for several months. Harvesting started toward the end of June and was in full swing by July 20. Rapid and simultaneous ripening is reported to have increased the normal strain at harvest time. Heat and strong winds and a significant amount of lodged grain, are factors, reported to be increasing harvesting losses. Delayed repairs to tractors and combines and a reported shortage of spare parts would also point to harvesting losses at least as great as the heavy losses of 1937.

In northern Africa harvesting is virtually completed and threshing is general. The total production is indicated to be a little above that of last year. In Morocco the yield is estimated to be well above that of last year. In Tunisia, however, a smaller crop is indicated for this year.

The latest estimate of the crop in India is 402,453,000 bushels compared with 392,075,000 in 1937. It is generally felt that the current crop has been overestimated.

On the basis of weather and yield studies, the crop in Argentina is tentatively placed at 250 million bushels, compared with the 1937-38 harvest of 185 million bushels. Wheat seeding in Argentina is virtually completed. The sown acreage is reported to be about 5 percent above that of last year and condition in general is above average.

In Australia conditions to date seem to indicate a crop of about 150 million bushels compared with 187 million for the last crop. The first official estimate of the area sown is 14,178,000 acres, an increase of 3 percent over last year. General rains are needed throughout the country as a deficiency of sub-soil moisture continues.

<sup>4/</sup> Estimate of the Paris office of the Bureau.

<sup>5/</sup> The Paris office of the Bureau regards this official estimate as being too high.

<sup>6/</sup> Estimate of the Belgrade office of the Bureau.

Compiled from official data except as otherwise noted.

World stocks\* about 75 million bushels larger than year ago

World stocks of old crop wheat <sup>6/</sup> on about July 1 are now tentatively estimated at 620 million bushels, which is about 75 million bushels more than those of a year earlier (table accompanying figure 7). This is 25 million bushels less than the tentative estimate of a month ago. Estimated stocks in the four principal exporting countries and afloat are shown on figure 5. Information regarding stocks in European countries is incomplete, but they are believed to be about the same as a year ago. Stocks in the Orient also are probably about the same.

The amount of the increase in United States stocks approximates the increase in the estimated world total. Small increases in stocks indicated for Argentina and Australia are about offset by decreases in Canada and in the United Kingdom ports and afloat.

If the final estimate of old stock wheat turns out to be about 620 million bushels, the world disappearance in 1937-38 would be about 3,790 million bushels, compared with the average of the preceding 10 years of 3,775 million, or about 15 million bushels more than average. However, the increase in the apparent disappearance in the United States last year (the result of heavy wheat feeding because of short feed grain supplies early in the season) was about equal to this reduction, and indicates not much change in disappearance in other countries.

Some increase in world wheat trade in 1938-39 probable

Although total world production is materially larger than last year, distribution of the crop is such that importing countries will probably take more wheat than last year. Based on a tentative estimate of carry-over in European importing countries and on present crop prospects it would appear that European imports in 1938-39 might be increased by 25 to 50 million bushels. Abnormal purchases, such as for reserve stocks, would increase this indication. Present prospects would seem to justify an increase of 5 to 10 million bushels in imports by non-European countries in 1938-39.

The estimate of net world imports for the year ended June 30, 1938, (total net imports into European deficit countries plus shipments to non-European countries) are estimated at 494 million bushels.

Wheat from the United States, however, will meet greater competition in foreign markets, and exports will be less than in 1937-38 unless the Federal Government takes steps to stimulate exports. Larger crops are in prospect this year in European exporting countries, Canada and Argentina.

---

\* Excluding Soviet Russia and China.

<sup>6/</sup> Some new wheat included in United States stocks; discussion on page 23.

In Canada, production is indicated to be the largest in 6 years, but the fixing of prices by the Government is not expected to interfere with exports. Accompanying the price announcement of August 4 the Minister of Trade and Commerce stated: "The milling and grain trades of the world are advised that, notwithstanding the internal initial price of 80 cents per bushel, the Canadian Wheat Board will continue its work of encouraging the use of Canadian wheat, which will at all times be competitive on the world's markets."

On the basis of current production estimates, the United States, Canada, Argentina, Australia and the exporting countries of Europe will have about 900 million bushels in excess of domestic disappearance and minimum carry-over. Exports from other countries, including Soviet Russia and India, would increase this amount.

With exportable surpluses of over 900 million bushels in prospect, imports of only between 525 and 550 million bushels would result in an increase of around 400 million bushels in the world carry-over in July 1939. Revisions in estimates, of course, would probably change these figures. If 400 million bushels are added to the tentative estimated world stocks July 1, 1938, of 620 million bushels, the world carry-over will about equal the carry-over of 1,020 million bushels in 1929. The record carry-over, estimated at 1,198 million bushels, occurred in 1934.

Information on the current movement of wheat, together with comparisons, are shown in tables 12 to 15. Quantities of United States wheat and flour exports by countries are shown in tables 9 and 10.

Prices in foreign markets have continued to decline

Wheat prices in foreign markets, where not fixed, have continued downward during the past month, influenced by upward revisions in crop estimates and liberal offerings in European markets.

1/ Empire wheat qualifying for Imperial Preference is exempt from duty (approximating 6 cents per bushel) under Ottawa Agreements of November 1932.

Table 2 shows prices of imported wheat in Liverpool. Prices of United States Hard Red Winter and White wheats declined only about 9 cents from July 15 to August 12 while prices of Russian and Argentine wheat declined 12 and 15 cents, respectively. Canadian wheat declined sharply, going down 23 cents.

The sharp drop in Canadian prices (28 cents from July 23 to August 20 for No. 1 Northern Spring) is the result of adjusting from a season when supplies of good milling wheat were very limited to a season when supplies are plentiful. The 1937 Canadian wheat crop was so small, and such a relatively small proportion of the crop qualified for the better grades, that 9 million bushels of milling wheat were imported from the United States. On the other hand, the 1938 crop in Canada is expected to be the largest since 1932 and prices have dropped to world levels.

The Canadian Government announced that it would pay 80 cents for No. 1 Northern Spring wheat, 77 cents for No. 2 and 74 cents for No. 3, basis Fort William and Port Arthur. These prices are somewhat below the loan schedule in the United States but Canadian farmers are to receive in addition participating certificates entitling them to share in any profits that may result should the wheat be disposed of at prices above the fixed minimum. United States No. 1 Northern Spring wheat is ordinarily fairly comparable for milling purposes with No. 3 Manitoba Northern Spring. The loan rate on No. 1 Northern Spring at Minneapolis was announced at 79 cents.

#### THE DOMESTIC WHEAT SITUATION

BACKGROUND.- The carry-over of wheat in the United States for the 5 years 1924-28 averaged about 115 million bushels. Stocks which began to accumulate in 1929 reached the record peak of 378 million bushels in 1933. Four small wheat crops, however, reduced stocks on a comparable basis to about 100 million bushels by July 1, 1937. Domestic disappearance during the 10 years 1928-37 averaged 680 million bushels.

Domestic wheat prices from the spring of 1933 to that of 1937 were unusually high relative to world market prices, because of four small domestic crops caused largely by abnormally low yields per acre. During 1936-37 both world and domestic prices advanced sharply as a result of increased demand and the smallest supplies in recent years.

Early in the 1937-38 season, domestic and foreign wheat prices rose sharply following reports of serious damage to the Canadian crop and the threat of rust damage in the United States. It was thought possible at that time that world prices might remain sufficiently above the 1936-37 level to offset the decline in United States prices to an export basis. However, with an increase in the estimates of the world crop, prospects of large shipments from Soviet Russia, a slow European demand, disturbed business conditions, and a falling general commodity price level, wheat prices in world markets declined.

United States wheat crop 5 percent under 1915 record

A total 1938 wheat crop of 955,989,000 bushels was indicated by August 1 reports on yield per acre of winter wheat and condition of spring wheat. This is slightly larger than the large crops harvested in 1931 and 1919 but about 5 percent less than the record crop of 1915. Estimated production of all wheat in 1937 was 873,993,000 bushels, and the 10-year (1927-36) average production is 752,891,000 bushels. The indicated total crop, as of August 1, is about 1 percent lower than that indicated on July 1 with a decrease in winter wheat nearly offset by the increase in prospective spring wheat production.

The preliminary estimate of winter wheat production is 688,458,000 bushels compared with 685,102,000 harvested in 1937 and the 10-year average of 546,396,000 bushels. The August 1 estimate represents a reduction of about 27 million bushels from July 1 indications.

The average yield per acre is 13.8 bushels compared with 14.6 bushels in 1937 and the 10-year (1927-36) average of 14.5. A month ago the indicated yield was 14.3 bushels. Figures 3 and 4 show the seeded acreage, yield, and production of all wheat and winter wheat, 1919-1938.

Most of the reduction during July 1 occurred in Kansas and Nebraska although sharp reductions in yield per acre also took place in Minnesota, Wisconsin and Iowa with slightly lower yields indicated for Pennsylvania, Michigan, Indiana, Missouri, and Oregon. Scab and blight reduced both yields and quality in parts of Minnesota and Wisconsin. In Nebraska, Kansas and Iowa, rust and hot weather damaged late fields, harvest was delayed by wet weather and considerable loss resulted from excessive lodging. Weather was unfavorable for harvesting and threshing in much of the area east of the Mississippi River and north of the Ohio where considerable damage has occurred to wheat in the shock. Yields in the States in this area, however, are mostly above average.

Production of all spring wheat (including durum) on August 1 was placed at 267,531,000 bushels, an increase of 15,544,000 bushels above the July 1 forecast, and 61,037,000 bushels above the 10-year (1927-36) average production. Last year, 188,891,000 bushels were produced.

Indicated production of Durum wheat increased from 33,376,000 bushels on July 1 to 41,148,000 bushels on August 1. Indicated yields per acre increased 2 bushels in North Dakota, 3 bushels in South Dakota, and 1.5 bushels in Minnesota since July 1. In 1937, the production of Durum was 27,791,000 bushels and the 10-year average is 40,085,000 bushels.

Prospects for other spring wheat held up or improved during July in all of the important wheat-producing States with the exception of Idaho, where a small decline occurred. The production of other spring wheat is indicated to be 226,383,000 bushels, compared with 218,611,000 indicated a month earlier, 161,100,000 harvested in 1937, and 166,410,000 bushels the 10-year average.

Improved prospects in Minnesota and the Dakotas are largely the result of less rust damage than was expected on July 1, when it became apparent that rust was more widespread than during either the 1935 or 1937 epidemic. The crop matured relatively early and July weather conditions, with rather cool temperatures during a portion of the month and below normal rainfall were unfavorable to the rapid development of the rust. Losses from rust damage also were reduced because of the comparatively large percentage of the acreage planted to rust-resistant varieties.

Grasshopper damage has been extensive in portions of the spring wheat territory, notably in north central South Dakota and in southern and western North Dakota. Some grasshopper damage also has occurred in northeastern Montana.

The quality of the market receipts of winter wheat in July 1938 is below a year ago (table 8).

United States carry-over largest since 1934

Stocks of old wheat in the United States at the beginning of the 1938-39 season on July 1 have been estimated at 154,072,000 bushels. These stocks compare with a revised estimate of 83,214,000 bushels of old wheat on hand July 1, 1937. This year for the first time, old and new wheat was reported separately by merchant mills, making possible a statement of stocks of old wheat only. New wheat always has been reported separately for farm, and interior mill and elevator stocks, and not used in the carry-over estimate.

When the new wheat in commercial stocks and merchant mills is included, July 1 stocks total 173,638,000 bushels, the largest since 1934 when they were 274,328,000 bushels. Stocks on July 1 last year, including new wheat in commercial and merchant mills were estimated at 102,889,000 bushels. Figure 1 and the accompanying table show the stocks in the various positions with and without the new wheat included in commercial and merchant mill stocks.

New wheat was reported in commercial stocks for 1937 as well as 1938, but was reported only for 1938 in merchant mill stocks. New wheat in merchant mills and elevators in 1937 were estimated on the bases of: (1) the percentage of new wheat in total wheat stocks in important winter wheat States in 1938, and (2) the percentage of new wheat reaching market centers in 1937 compared with 1938 as represented by commercial stocks.

It is interesting to note that domestic disappearance rounds to 702 million bushels using either set of stocks figures.

Supplies of all classes of wheat abundant

Table 4 shows the estimated July 1 carry-over of old wheat, current crop estimates and estimated prospective utilization, by classes for 1938-39. The actual utilization by classes will depend, of course, on a number of factors, two of which are the prices of wheat relative to feed grain prices and supplies in the various sections of the country, and the relative prices of the different classes of wheat.

1/ Bureau of Census figure raised to represent all merchant mills and elevators. Includes stored for others as well as wheat owned. 2/ August estimate.

Table 3 shows the estimated supply and distribution by classes for 1937-38 with stocks containing only old wheat. Table 7 shows the analysis by classes with new wheat in the commercial and merchant mill stocks in all years. Practically all of this new wheat in these two stocks positions is hard red winter wheat.

Domestic wheat prices have recently strengthened

Domestic wheat prices continued to decline during the past month, influenced by large prospective domestic and world supplies, but they did not decline as much as prices in other countries (tables 2 and 5), due at least in part to the actual and prospective effect of the loan in reducing marketings. As prices declined to their low point, marketings fell off sharply. Moreover, the heavy movement of spring wheat is expected to be of short duration.

Domestic wheat prices have turned up since the middle of the month, following the announcements of additional Agricultural Adjustment payments to growers who cooperate in adjusting acreage and the Federal Government's interest in stimulating exports.

Market receipts of winter wheat have dropped off earlier than usual. The relatively large stocks of old crop wheat have been materially reduced and much of the wheat not eligible as collateral already has moved to market. Consequently, the effect of the loan as a price supporting factor should become more apparent.

Table 6 shows weighted average cash prices by weeks, in important wheat markets this year compared with last year.

<sup>1/</sup> Includes new wheat in commercial and merchant mill stocks.

<sup>2/</sup> From reports of Foreign and Domestic commerce of the United States. Imports include full-duty wheat, wheat paying a duty of 10 percent ad valorem, and flour in terms of wheat. Exports include only flour made from domestic wheat. Shipments are to Alaska, Hawaii, Puerto Rico and the Virgin Islands.

<sup>3/</sup> Balancing item.

See also tables 3 and 4 in this issue; also "The Wheat Situation," February 1937 for the figures for 1930-31 and August 1937 for the figures for 1931-32 to 1933-34.

## OUTLOOK FOR THE 1939 RYE CROP

BACKGROUND - During the past 10 years rye acreage harvested has remained above the pre-war level, but has been below the high level reached at the close of the War (fig. 9). The increase in rye production during the War period was due largely to an expansion of rye acreage into the sub-humid area of the spring Wheat Belt. Since 1924 yields have been generally below the average for the years 1910-15 and acreage abandonment somewhat larger. In 1933, 1934 and 1936, droughts greatly reduced rye yields, caused heavy abandonment and reduced supplies below domestic disappearance. With more favorable growing seasons in 1935 and 1937 yields and production were much above the 10-year average.

With rye prices <sup>7/</sup> only a little more than half of what they were in 1937 and feed supplies ample, growers will probably reduce their rye acreage from that of this year, when it is estimated that 3,914,000 acres were harvested. For the 5 years, 1928-32, the harvested acreage averaged 3,315,000 acres (fig.9). It is not probable, however, that the acreage next year will decline to this average. An average acreage, with average (1913-37) yields of 12.0 bushels would produce a crop of about 40 million bushels, which would take care of domestic needs. With average yields on an acreage larger than average, the excess of supply over disappearance would be increased, unless prices and supplies of rye relative to other feed grains induced increased feeding. While average yields have been used in these computations, it is well to recognize variations in yields which are very important in determining production (fig.9).

Table 16 shows the supply and distribution of rye during the past 3 years <sup>8/</sup>. Disappearance in 1937-38 was apparently about 42 million bushels. This is probably somewhat larger than may be expected in 1939-40 unless feed grain supplies are small, as in late 1936 and before corn was harvested in 1937. Domestic disappearance appears to be consisting of about 8 million bushels for seed, 7 to 10 million bushels for distilling, 8 to 10 million bushels for flour and 10 to 20 million bushels for feed.

Rye supplies in 1938-39, estimated at 62,300,000 bushels are 10 million bushels or more in excess of usual domestic disappearance. These supplies may result in a large carry-over at the beginning of the 1939 crop year because export prospects are less favorable and there are ample supplies of feed grains on hand. Net exports of rye from the United States in 1937-38 totaled about 4 million bushels. These largely replaced exports from Poland, which country had a very small crop in 1937.

<sup>7/</sup> Statement on rye prices in "The Wheat Situation," July 23, 1938, page 20, last sentence, referred to No. 2 Rye at Minneapolis.

<sup>8/</sup> Estimated farm stocks available only for 3 years.

Present prospects are for a European rye crop of around 905 million bushels, according to the Berlin office of the Bureau of Agricultural Economics. This would indicate an increase of about 10 percent compared with last year, and would provide significant quantities available for export, especially in Poland and the Danube Basin. (Table 17 shows the relative importance of the various exporting countries.) Poland has the best combined wheat and rye prospects since the record crops of 1933. On the basis of present prospects the rye crop is estimated to be around 260 million bushels compared with 222 million in 1937. In Germany, although acreage is about 6 percent below average, a yield of about 303 million bushels is in prospect. This is the largest crop since 1933. The yield in Czechoslovakia, estimated at 65 million bushels, is well above that of the past 2 years. Heavy rains recently are reported to have caused considerable lodging. This, together with a reported shortage of farm labor, may cause harvesting difficulties.

## THE FLAXSEED SITUATION

BACKGROUND.- Prior to 1908 the United States production of flaxseed was generally in excess of domestic requirements, but since that time we have shifted from an export to an import basis. From 1910 to 1920, domestic flaxseed supplied more than one-half of our domestic requirements; from 1920 to 1929 between one-fourth and one-half. Production since 1928 has been greatly reduced as a result of low yields and reduced acreage. Domestic demand for flaxseed was at a low level during 1931 and 1932, but in the past few years it has improved materially. Prices of flaxseed have improved substantially from the low level reached in 1932, and in the past 2 years have been at the highest level since 1929-30.

Supplies of Flaxseed

Foreign supplies.- The world production of flaxseed in 1937-38 is now estimated at around 135 million bushels, or about 12 million bushels under the estimated harvest of 1936-37. Most of the decrease this year is due to a reduction in the size of the Argentine crop which was harvested early in 1938. This crop was only about 61 million bushels as compared with 76 million in 1936-37. Since Argentina furnishes by far the largest percentage of the commercial world supplies of flaxseed, the world level of flaxseed prices is dependent largely on supplies in the Argentine, together with the general world demand situation. Little information is yet available on the prospects for the 1938-39 Argentine crop to be harvested late this year and early in 1939, but such information as is available indicates that a somewhat larger crop is in prospect than was harvested during the past year. Weather conditions have been favorable for seeding and early growth of the crop, and some increase in acreage appears probable. Production in 1938-39 in other countries so far reported is above that of 1937-38, and it now appears probable that total world flaxseed production this coming year may be somewhat larger than in 1937-38.

Domestic supplies.- On the basis of August 1 indications, the 1938 United States flaxseed crop will be about 8,185,000 bushels compared with 6,974,000 bushels last year. The carry-over on July 1 has been estimated at 2,199,000 bushels, making a total domestic supply of about 10,400,000 bushels, which, with the exception of 1935-36, is the largest supply since 1932-33. The indicated yield for 1938 is 8.2 bushels per acre, which compares with 7.5 last year and 6.0 bushels per acre for the period 1927-36. While the 1938 indicated crop is generally larger than in any of the past few years except 1935, it is much less than one-half of the production during the years 1924 to 1928.

Although domestic requirements of flaxseed may be somewhat less during the 1938-39 marketing year than in the past 2 years, they are expected to be considerably larger than domestic supplies, and the total utilization of flaxseed may be again made up of more than one-half foreign flaxseed. In the marketing year 1936-37, domestic production was only large enough to supply

about one-sixth of our requirements, and in 1937-38 about one-fourth of our requirements. Since the beginning of 1938, imports of flaxseed have been much smaller than during the greater part of 1937. During the period April through June, imports totaled 2,663,000 bushels compared with 8,604,000 bushels in the same period of 1937. Total imports for the crop year 1937-38, beginning July 1, amounted to 17,860,000 bushels compared with 26,096,000 bushels in 1936-37.

#### Demand for Flaxseed

The demand for flaxseed products was unusually favorable during the greater part of 1936-37 as a result of the increased volume of building activity and a shortage of high protein feeds as a result of the drought. Since late in 1937, demand has fallen off materially and the rate of flaxseed crushing has made a comparable decline. In the past 2 or 3 months some upturn in total consumption of linseed oil has occurred, and some further improvement is anticipated for the next few months, in view of recent improvement in the outlook for private building, together with the Government's steps to increase residential building. According to reports of the National Lumber Manufacturers' Association, orders of new lumber by mills during the week ended July 16 reached the highest point since April 1937.

The total value of building permits in 215 cities for the first half of 1938 amounted to about \$528,000,000 compared with \$586,000,000 in the first 6 months of 1937 and \$464,000,000 in the same period of 1936. The Federal Reserve Board index of the total value of building contracts awarded declined from a high level of 67 percent of the 1923-25 average in July 1937 to 46 percent of this same average for March 1938. Since March this index has increased, and the average figure for June was 54 percent.

#### Prices of Flaxseed

Prices of both domestic and foreign flaxseed have declined considerably during the past year. The price of No. 1 flaxseed at Minneapolis has dropped about 35 cents per bushel since the first of the year, and for the week ended July 30 averaged \$1.80. At Buenos Aires the price has declined somewhat less than in this country so far this year, and the margin has become narrower. During most of February the margin between prices at Minneapolis and at Buenos Aires was about 80 cents per bushel, whereas this margin for the week ended July 30 was only about 61 cents per bushel, or 4 cents below the import duty of 65 cents per bushel on flaxseed. The weakness in flaxseed prices during the first half of this year has apparently been due largely to the less favorable demand situation, both domestic and foreign.

Although flaxseed prices have been relatively high as compared with wheat prices, the total returns from flaxseed have been low in a number of the years since 1930, as a result of low yields. On the basis of present yield figures and prices of flaxseed and wheat, however, it appears that farmers will receive considerably larger returns this year per acre of flaxseed than per acre of wheat. While flaxseed prices during the next few months will probably be slightly below the general level of prices a year ago, they are expected to continue well above prices during the years 1930-35.
